## Dynamics

## Motion

## ACCELERATION

This refers to the motion of a body whose velocity is not uniform. Suppose the velocity of a body goes on changing at a uniform rate, then the rate of change of velocity is called acceleration. This is denoted by " f " or " a ".

$$
\text { acceleration }=\frac{\text { change of velocity }}{\text { time taken }}
$$

## EQUATION OF MOTION

1. $v=a t+u$
2. $\mathrm{s}=\frac{a t^{2}}{2}+\mathrm{ut}$
3. $\mathrm{v}^{2}=2 \mathrm{as}+\mathrm{u}^{2}$

These equations have been obtained for the case of a body moving with positive uniform acceleration. If the body be moving with negative uniform acceleration i.e. with uniform retardation of $f$ units per $\sec ^{2}$ the following relations will hold good.

1. $v=u-a t$
2. $s=u t-\frac{1}{2} \mathrm{at}^{2}$
3. $v^{2}=u^{2}-2 a s$
where $\mathrm{v}=$ velocity of a body at a certain instant; $\mathrm{u}=$ initial velocity; $\mathrm{t}=$ time

## Example (AMIE S05, 6 marks)

Derive the following equations of motion of a body moving in a straight line with uniform acceleration:
(i) $S=u t+\frac{1}{2} a t^{2}$
(ii) $V^{2}=u^{2}+2 a S$

## Solution

Let " $u$ " is initial velocity and "a "is constant acceleration.
We are interested to find the velocity v and the distance " s ' travelled after any time " t ".

Acceleration $\quad a=\frac{d^{2} s}{d t^{2}}$
Integrating with respect to $t$

$$
\frac{d s}{d t}=a t+c_{1}
$$

where $\mathrm{c}_{1}$ is a constant of integration.
When $\mathrm{t}=0$, $\mathrm{ds} / \mathrm{dt}=\mathrm{u}$ Hence $\mathrm{c}_{1}=\mathrm{u}$
or

$$
\begin{equation*}
\frac{d s}{d t}=a t+u \tag{1}
\end{equation*}
$$

i.e. $\quad v=u+a t$

Integrating again with respect to $t$

$$
s=\frac{a t^{2}}{2}+u t+c_{2}
$$

where $c_{2}$ is another constant of integration.
When $\mathrm{t}=0, \mathrm{~s}=0$. Hence $\mathrm{c}_{2}=0$

$$
\begin{equation*}
\therefore \quad s=u t+\frac{1}{2} a t^{2} \tag{2}
\end{equation*}
$$

From (1), we have

$$
t=\frac{v-u}{a}
$$

Substituting in (2)

$$
\begin{align*}
& s=u\left(\frac{v-u}{a}\right)+\frac{1}{2} a\left(\frac{v-u}{a}\right)^{2}=\frac{u v-u^{2}}{a}+\frac{1}{2} \frac{(v-u)^{2}}{a} \\
& 2 a s=2 u(v-u)+(v-u)^{2}=(v-u)(v+u) \\
& 2 a s=v^{2}-u^{2} \\
\therefore \quad & v^{2}=u^{2}+2 a s \tag{3}
\end{align*}
$$

## Example

The brakes of a train reduce its speed from 60 to $20 \mathrm{~km} / \mathrm{h}$ while it runs 200 m . Assuming that there exists constant retarding force, find (a) how much further the train will run before coming to rest, and (b) how long will it take.

Given that $\quad u=60 \mathrm{~km} / \mathrm{h}, \mathrm{v}=20 \mathrm{~km} / \mathrm{h}, \mathrm{s}=200 \mathrm{~m}=0.2 \mathrm{~km}$
Now $\quad v^{2}-u^{2}=2$ as
i.e. $\quad 400-3600=2 \times \mathrm{ax} 0.2$
i.e. $\quad a=-3200 / 0.4=-8000 \mathrm{~km} / \mathrm{h}^{2}$
(a) For the train to come to rest, $\mathrm{v}=0$

$$
\begin{aligned}
& \mathrm{v}^{2}=\mathrm{u}^{2}+2 \mathrm{as} \\
& 0=3600-2 \mathrm{x} 8000 \mathrm{x} \mathrm{~s}
\end{aligned}
$$

i.e. $\quad \mathrm{s}=3600 / 16000=0.225 \mathrm{~km}=225 \mathrm{~m}$

Further distance moved $=225-200=25 \mathrm{~m}$
(b)

$$
\mathrm{v}=\mathrm{at}
$$

$$
0=20-8000 t
$$

$$
\therefore \quad t=20 / 8000=1 / 400 \text { hour }=9 \mathrm{sec}
$$

## Example

Two cars start off to race with velocities $v_{1}$ and $v_{2}$ and travel in a straight line with uniform acceleration $a_{1}$ and $a_{2}$. If the result to be dead heat, prove that the length of the course is

$$
\frac{2\left(v_{1}-v_{2}\right)\left(v_{1} a_{2}-v_{2} a_{1}\right)}{\left(a_{2}-a_{1}\right)^{2}}
$$

## Solution

Let the length of the course be x km . Since the result of the race is a dead heat, the cars reach the destination at the same time. Suppose each car takes time t hours.

For the first car

$$
\begin{align*}
& \mathrm{u}
\end{align*}=\mathrm{v}_{1}, \mathrm{a}=\mathrm{a}_{1}, \mathrm{t}=\mathrm{t}, \mathrm{~s}=\mathrm{x} ~ 子 \quad \mathrm{~s}=\mathrm{ut}+\frac{1}{2} \mathrm{at}^{2} \text { gives } \mathrm{x}=\mathrm{v}_{1} \mathrm{t}+\frac{1}{2} \mathrm{a}_{1} \mathrm{t}^{2} \text {. }
$$

For the second car, we have

$$
\begin{array}{ll} 
& \mathrm{u}=\mathrm{v}_{2}, \mathrm{a}=\mathrm{a}_{2}, \mathrm{t}=\mathrm{t}, \mathrm{~s}=\mathrm{x} \\
\therefore & \mathrm{x}=\mathrm{v}_{2} \mathrm{t}+\frac{1}{2} \mathrm{a}_{2} \mathrm{t}^{2} \tag{2}
\end{array}
$$

From eqs. (1) and (2), we get

$$
\begin{array}{ll} 
& v_{1} t+\frac{1}{2} a_{1} t^{2}=v_{2} t+\frac{1}{2} a_{2} t^{2} \\
\therefore & t\left[\frac{\left(a_{2}-a_{2}\right) t}{2}+\left(v_{2}-v_{1}\right)\right]=0
\end{array}
$$

Rejecting the solution $t=0$, which corresponds to the initial position, we get

$$
\mathrm{t}=\frac{2\left(\mathrm{v}_{1}-\mathrm{v}_{2}\right)}{\left(\mathrm{a}_{2}-\mathrm{a}_{1}\right)}
$$

Substituting in (1), we get

$$
x=\frac{2 v_{1}\left(v_{1}-v_{2}\right)}{\left(a_{2}-a_{1}\right)}+\frac{1}{2} a_{1}\left\{\frac{2\left(v_{1}-v_{2}\right)}{\left(a_{2}-a_{1}\right)}\right\}^{2}
$$

After solving we get

$$
x=\frac{2\left(v_{1}-v_{2}\right)\left(v_{1} a_{2}-v_{2} a_{1}\right)}{\left(a_{2}-a_{1}\right)^{2}}
$$

## Problem

A particle moving with uniform acceleration in a straight line passes points $A, B$, C. If $A B=$ $B C=d$, and if the time from $A$ to $B$ is $t_{1}$ and $B$ to $C$ is $t_{2}$, prove that acceleration is

$$
\frac{2 \mathrm{~d}\left(\mathrm{t}_{1}-\mathrm{t}_{2}\right)}{\mathrm{t}_{1} \mathrm{t}_{2}\left(\mathrm{t}_{1}+\mathrm{t}_{2}\right)}
$$

## ACCELERATION DUE TO GRAVITY

A body which is free to move entirely under the influence of the attraction of the earth will be subjected to an acceleration directed towards the centre of the earth. This acceleration is called acceleration due to gravity. When a uniform acceleration is assumed, its value is generally taken as $9.81 \mathrm{~m} / \mathrm{sec}^{2}$. It is denoted by g .

## Body Moving Vertically Downward

1. $\mathrm{v}=\mathrm{u}+\mathrm{gt}$
2. $\mathrm{s}=\mathrm{ut}+\frac{1}{2} \mathrm{gt}^{2}$
3. $v^{2}=u^{2}+2 g s$

## Body Projected Vertically Upwards

1. $\mathrm{v}=\mathrm{u}-\mathrm{gt}$
2. $\mathrm{s}=\mathrm{ut}-\frac{1}{2} \mathrm{gt}^{2}$
3. $v^{2}=u^{2}-2 g s$

## Body Just Dropped

here $u=0$

1. $\mathrm{v}=\mathrm{gt}$
2. $\mathrm{s}=\frac{1}{2} \mathrm{gt}^{2}$
3. $\mathrm{v}^{2}=2 \mathrm{gs}$

## Example (AMIE S11, 12, 13, 5 marks)

A stone after falling 4 seconds from rest breaks a glass pane and in breaking it losses $25 \%$ of its velocity. How far will it fall in the next second ? $g=9.81 \mathrm{~m} / \mathrm{s}^{2}$.

## Solution

Velocity acquired in 4 seconds in falling from rest $=v=u+g t=0+9.81 \times 4=39.24 \mathrm{~m} / \mathrm{sec}$.
Since the stone loses $25 \%$ of its velocity, its velocity after breaking the glass pane $=39.24 \mathrm{x}$ $(3 / 4)=29.43 \mathrm{~m} / \mathrm{s}$.
$\therefore$ Distance by which the stone will fall in the next one second

$$
\begin{aligned}
\mathrm{s}=\mathrm{ut}+\frac{1}{2} \mathrm{gt}^{2} & =(29.43 \times 1) \times\left(\frac{1}{2} \times 9.81 \times 1^{2}\right) \\
& =34.335
\end{aligned}
$$

Answer

## Example

A particle falls from rest and in the last second of its motion it passes 70 m . Find the height from which it fell and the time of its fall. $g=9.81 \mathrm{~m} / \mathrm{s}^{2}$.

## Solution

Let $t$ be the total time of fall.
Distance travelled in t seconds

$$
\mathrm{s}_{1}=\frac{1}{2} \mathrm{gt}^{2}
$$

Distance travelled in ( $\mathrm{t}-1$ ) seconds

$$
\mathrm{s}_{2}=\frac{1}{2} \mathrm{~g}(\mathrm{t}-1)^{2}
$$

Distance travelled during the last second of its fall

$$
\begin{array}{ll} 
& \mathrm{s}_{1}-\mathrm{s}_{2}=\frac{1}{2} \mathrm{~g}\left[\mathrm{t}^{2}-(\mathrm{t}-1)^{2}\right]=70 \mathrm{~m} \\
\therefore & \frac{1}{2} \times 9.8 \times(2 \mathrm{t}-1)=70 \\
\therefore & \mathrm{t}=7.64 \mathrm{~s}
\end{array}
$$

Height from which the particles fell $=\mathrm{s}_{1}=\frac{1}{2} \times 9.81 \times(7.64)=\mathbf{2 8 6 . 1} \mathbf{~ m}$

## Example

A particle is dropped from the top of a tower 200 m high and another particle is projected at the same time vertically upwards from the foot of the tower so as to meet the first particle at a height of 50 m . Find the velocity of projection of the second particle.

## Solution

Let the particles meet after t seconds. The first particle falls from rest a distance $=200-50=$ 150 m .

Hence $\quad 150=\frac{1}{2} \mathrm{gt}^{2}$

$$
\begin{equation*}
\mathrm{t}=\sqrt{\frac{150 \mathrm{x} 2}{9.81}}=5.53 \mathrm{sec} \tag{1}
\end{equation*}
$$

If $u$ is the required velocity of the second particle, then

$$
\begin{equation*}
50=\mathrm{ut}-\frac{1}{2} \mathrm{gt}^{2} \tag{2}
\end{equation*}
$$

Adding eqs (1) and (2), we get

$$
\begin{array}{ll} 
& 200=\mathrm{ut} \\
\therefore & \mathrm{u}=200 / 5.53=36.17 \mathrm{~m} / \mathrm{s}
\end{array}
$$

## Example

Two balls are projected simultaneously with the same velocity from the top of a tower, one vertically upwards and the other vertically downwards. If they reach the ground in times $t_{1}$ and $t_{2}$ respectively, show that $\mathrm{t}_{1} t_{2}$ is the time which each will take to reach the ground if simply let drop from the top of the tower.

## Solution

Let $\mathrm{h}=$ height of the tower and $\mathrm{u}=$ velocity of projection
Taking downward direction positive, for the first ball, we have

$$
\mathrm{u}=-\mathrm{u}, \mathrm{~s}=\mathrm{h}, \mathrm{t}=\mathrm{t}_{1}, \mathrm{a}=\mathrm{g}
$$

$$
\begin{align*}
& \mathrm{s}=\mathrm{ut}+\frac{1}{2} \mathrm{gt}^{2} \text { gives } \\
& \mathrm{h}=\mathrm{ut}_{1}+\frac{1}{2} \mathrm{gt}_{1}{ }^{2} \tag{1}
\end{align*}
$$

For the second ball,

$$
\begin{align*}
& \mathrm{u}=\mathrm{u}, \mathrm{~s}=\mathrm{h}, \mathrm{t}=\mathrm{t}_{2} \mathrm{a}=\mathrm{g} \\
& \mathrm{~h}=\mathrm{ut}_{2}+\frac{1}{2} \mathrm{gt}_{2}{ }^{2} \tag{2}
\end{align*}
$$

Eliminating $u$ from Eqs. (1) and (2), we get

$$
\mathrm{h}=\frac{1}{2} \mathrm{gt}_{1} \mathrm{t}_{2}
$$

If $t$ is the time to reach the ground when initial velocity is zero, we get

$$
\begin{array}{ll} 
& \mathrm{s}=\frac{1}{2} \mathrm{gt}^{2} \\
& \frac{1}{2} \mathrm{gt}_{1} \mathrm{t}_{2}=\frac{1}{2} \mathrm{gt}^{2} \\
\therefore \quad & \mathrm{t}=\sqrt{\mathrm{t}_{1} \mathrm{t}_{2}} .
\end{array}
$$

## Example

$A$ stone projected vertically upwards from a point $A$ passes a point $B$ after 3 seconds. If it returns to $A$ after a further interval of 4 second, find (i) the height of $B$ above $A$ (ii) the velocity with which the stone passes the point midway between $A$ and $B$.

## Solution

Let $\mathbf{u}=$ velocity of projection
$\mathrm{x}=$ maximum height reached
Time taken from A to C and back to A

$$
\begin{aligned}
& =3+4=7 \mathrm{~s} \\
0 & =\mathrm{ux} 7-\frac{1}{2} \times 9.81 \times 49 \\
\text { or } \quad u & =\frac{9.81 \times 49}{2 \times 7}=34.3 \mathrm{~ms}^{-1}
\end{aligned}
$$

Time taken from A to $\mathrm{B}=3 \mathrm{~s}$

$$
\mathrm{s}=\mathrm{ut}-\frac{1}{2} \mathrm{gt}^{2}=34.3 \times 3-\frac{1}{2} 9.81 \mathrm{x} 9=102.9-44.1
$$

| or | AB $=58.8 \mathrm{~m}$ |  |  |
| :--- | :--- | :--- | :--- | :--- |
| SECOND FLOOR, SULTAN TOWER, ROORKEE - 247667 UTTARAKHAND | PH: (01332) 266328 Web: www.amiestuycircle.com | $7 / 35$ |  |

$$
\begin{aligned}
& A D=\frac{1}{2} \mathrm{AB}=29.4 \mathrm{~m} \\
& \mathrm{v}^{2}-\mathrm{u}^{2}=2 \mathrm{gs} \Rightarrow \mathrm{v}^{2}-(34.3)^{2}=-2 \times 9.81 \times 29.4 \\
& \mathrm{v}^{2}=-576.83+1176.5=599.67 \\
\therefore \quad & \mathrm{v}=24.5 \mathrm{~ms}^{-1}
\end{aligned}
$$

## Problem

A stone projected vertically upwards from a point $O$ passes a point A three seconds after projection. If it returns to $O$ after a further interval of four seconds, find (a) the height of $A$ above $O$ (b) the velocity with which the stone passes the point midway between $O$ and $A$.

Answer: $58.86 \mathrm{~m}, 42.12 \mathrm{~m} / \mathrm{s}$

## Problem

From a balloon rising vertically upwards with a velocity of $10 \mathrm{~m} / \mathrm{s}$ a stone is let fall which reaches the ground in 15 seconds. Find how high the balloon was when the stone was stopped.

Answer: 953.625 m

## Problem

A particle is projected vertically upwards with a velocity of $u \mathrm{~m} / \mathrm{s}$ and after $t$ seconds another particle is projected upwards from the same point and with the same velocity. Prove that the particles will meet at a height $\frac{4 \mathrm{u}^{2}-\mathrm{g}^{2} \mathrm{t}^{2}}{8 \mathrm{~g}} \mathrm{~m}$ after a time $\left(\frac{\mathrm{t}}{2}+\frac{\mathrm{u}}{\mathrm{g}}\right)$ seconds from the start.

## Example( AMIE S 95 )

An aircraft carrier $C$ is flying horizontally with a constant speed of $60 \mathrm{~m} / \mathrm{s}$ at an altitude of 900 m . If the pilot drops a package with the same horizontal speed, determine the angle $\theta$ at which he must sight the target B so that the package strikes B. Neglect air resistance.

## Solution

Refer to fig (b). This figure shows the given arrangement along with the aircraft carrier speed u equal to $60 \mathrm{~m} / \mathrm{s}$.

Let $B$ be the point referred to as the target.

From the point $C$, the package is dropped with the same horizontal speed $u(=60 \mathrm{~m} / \mathrm{s})$ so as to strike the target $B$.

Considering now the vertical component of the package velocity.
At C

$$
\mathrm{u}=0, \text { and } \mathrm{g}=9.81 \mathrm{~m} / \mathrm{s}^{2}
$$

We know

$$
S=u t+\frac{1}{2} g t^{2}
$$

where $\mathrm{t}=$ time required by the package to strike the target at B .
Then

$$
900=\frac{1}{2} \times 9.81 \mathrm{x} \mathrm{t}^{2}
$$

$$
\therefore \quad \mathrm{t}=13.545 \mathrm{sec} .
$$

Horizontal distance CA covered by the package is given by

$$
\mathrm{S}=\mathrm{u} . \mathrm{t}=60 \times 13.545=812.7 \mathrm{~m}
$$

i.e. the package was released from the aircraft carrier when the horizontal distance is 812.7 m from $B$.

From fig (b), we see

$$
\tan \theta=\frac{A B}{A C}=\frac{900}{812.7}=1.1074
$$

$$
\therefore \quad \theta=\tan ^{-1} 1.1074=47.92^{\circ} \quad \text { Answer }
$$

## Example

A lift starts from rest and attains a speed of $4.9 \mathrm{~m} / \mathrm{sec}$ in 2 secs. Find the weight of a 80 kg main in the lift if the lift is (i) moving up (ii) moving down.

## Solution

$$
\mathrm{a}=(\mathrm{V}-\mathrm{u}) / \mathrm{t}=(4.5-0) / 2=2.25 \mathrm{~m} / \mathrm{s}^{2}
$$

Let R be the upward reaction of the lift. Apparent weight $=\mathrm{R}$
(i) Lift moving up: $\mathrm{R}-\mathrm{mg}=\mathrm{ma}$, Putting values, we find $\mathrm{R}=98.35 \mathrm{~kg}$
(ii) Lift moving down: $\mathrm{mg}-\mathrm{R}=\mathrm{ma}$, Hence $\mathrm{R}=61.65 \mathrm{~kg}$

## Projectiles

Angle of Projection : When a particle is projected into space, the angle between the direction of projection and the horizontal plane through the point of projection is called the angle of projection.

Trajectory : The path traced by a particle projected is called the trajectory of the particle.
Horizontal Range : The distance between the point of projection and the point where the path of the projectile meets the horizontal plane through the point of projection is called the horizontal range.

$$
\mathrm{R}=\mathrm{u} \cos \alpha \cdot \mathrm{~T}=\mathrm{u} \cos \alpha \cdot \frac{2 \mathrm{u} \sin \alpha}{\mathrm{~g}}=\frac{\mathrm{u}^{2}}{\mathrm{~g}} \cdot \sin 2 \alpha
$$

Range will be maximum when $2 \alpha=90^{\circ}$ i.e. $\alpha=45^{\circ}$

$$
\therefore \quad R_{\max }=\frac{u^{2}}{g}
$$

Time of Flight : This is the duration for which the particle is in motion.

$$
\mathrm{T}=\frac{2 \mathrm{u} \sin \alpha}{\mathrm{~g}}
$$

Equation of projectile Path: Projectile path is a parabola whose equation is

$$
y=x \tan \alpha-\frac{1}{2} g \cdot \frac{x^{2}}{u^{2} \cos ^{2} \alpha}
$$

Greatest Height. The greatest height $\mathrm{BC}=$ the ordinate of the vertex

$$
=\frac{u^{2} \sin ^{2} \alpha}{2 g}
$$

Now

$$
y=u \sin \alpha \cdot t-\frac{1}{2} g t^{2}
$$

At the greatest height, the vertical component of the velocity must vanish. Hence
or

$$
\frac{d y}{d t}=0
$$

$$
u \sin \alpha-g t=0
$$

$$
\begin{aligned}
& t=\frac{u \sin \alpha}{g} \\
& \therefore \quad y_{\max }=u \sin \alpha \cdot \frac{u \sin \alpha}{g}-\frac{1}{2} g \cdot \frac{u^{2} \sin ^{2} \alpha}{g^{2}} \\
& \\
& =\frac{u^{2} \sin ^{2} \alpha}{g}-\frac{1}{2} \frac{u^{2} \sin ^{2} \alpha}{g} \\
& \\
& =\frac{u^{2} \sin \alpha}{2 g}
\end{aligned}
$$

## Example

A particle is projected with a velocity of $10 \mathrm{~m} / \mathrm{s}$ at an angle of elevation $60^{\circ}$. Find (a) the equation to its path (b) the length of the latus rectum (c) greatest height attained (d) height of the directrix of the path (e) time required for covering the range and (f) length of the range.

## Solution

Given $u=10 \mathrm{~m} / \mathrm{s}$ and $\alpha=60^{\circ}$
(a) The equation to the path is

$$
\begin{array}{ll} 
& y=x \tan \alpha-\frac{\mathrm{gx}^{2}}{2 \mathrm{u}^{2} \cos ^{2} \alpha}=x \tan 60^{\circ}-\frac{9.81 \mathrm{x}^{2}}{2 \mathrm{x} 100 \mathrm{x} \cos ^{2} 60^{\circ}} \\
\therefore \quad & y=1.732 \mathrm{x}-0.1962 \mathrm{x}^{2}
\end{array}
$$

(b) Latus rectum $=\frac{2 \mathrm{u}^{2} \cos ^{2} \alpha}{\mathrm{~g}}=\frac{2 \times 100 \mathrm{x}(1 / 4)}{9.81}=5.097 \mathrm{~m}$
(c) Greatest height $=\frac{\mathrm{u}^{2} \sin ^{2} \alpha}{2 \mathrm{~g}}=\frac{100 \times(3 / 4)}{2 \times 9.81}=3.823 \mathrm{~m}$
(d) Height of directrix $=\frac{u^{2}}{2 g}=\frac{100}{2 \times 9.81}=5.097 \mathrm{~m}$
(e) Time of covering the range

$$
\mathrm{T}=\frac{2 \mathrm{u} \sin \alpha}{\mathrm{~g}}=\frac{2 \mathrm{x} 10}{9.81} \mathrm{x} \frac{\sqrt{3}}{2}=1.765 \mathrm{~s}
$$

(f) Horizontal range

$$
\mathrm{R}=\frac{\mathrm{u}^{2}}{\mathrm{~g}} \sin 2 \alpha=\frac{100}{9.81} \mathrm{x} \frac{\sqrt{3}}{2}=8.828 \mathrm{~m}
$$

A particle is projected at a velocity $u$. Find the angle of projection in order the horizontal range is a maximum.

## Solution

Let $\alpha$ be the angle of projection.
$\therefore \quad$ Range $=\frac{u^{2}}{g} \cdot \sin 2 \alpha$
The range is maximum when $\sin 2 \alpha=1$.

$$
\begin{array}{ll}
\text { i.e. } & 2 \alpha=90^{\circ} \\
\therefore & \alpha=45^{\circ}
\end{array}
$$

The angle of projection should be $45^{0}$.
Maximum range $=\frac{u^{2}}{g}$
Answer

## Example

A projectile is projected with a velocity of $45 \mathrm{~m} / \mathrm{s}$ at an angle of elevation of $30^{\circ}$ with the horizontal. Find,
(i) The maximum height reached by the projectile
(ii) The time of flight
(iii) The range of the projectile.

## Solution

$\mathrm{u}=45 \mathrm{~m} / \mathrm{s}, \alpha=30^{\circ}$
Maximum height reached by the projectile $=\frac{u^{2} \sin ^{2} \alpha}{2 g}=\frac{45^{2} \sin ^{2} 30}{2 \times 9.81}=25.80 \mathrm{~m}$
Time of flight $=\frac{2 u \sin \alpha}{g}=\frac{2 \times 45 \sin 30^{\circ}}{9.81}=4.59 \mathrm{sec}$.
Range of the projectile $=\frac{u^{2}}{g} \cdot \sin 2 \alpha=\frac{45^{2}}{9.81} \cdot \sin 60^{\circ}=178.77 \mathrm{~m}$.

## Problem

The maximum range of a projectile is found to be 3000 m . Find the angle of projection for which the range will be 2250 m if the velocity of projection remains the same.
Answer : $\alpha=24^{\circ} 18^{\prime}$ or $65^{\circ} 42^{\prime}$

## MECHANICAL SCIENCE <br> DYNAMICS <br> Problem

# AMIE(I) <br> STUDY CIRCLE(REGD.) 

A Focused Approac

Find the maximum horizontal range of a cricket ball projected with a velocity of $15 \mathrm{~m} / \mathrm{s}$.
If the ball is to have a range of 20 m , find the least angle of projection and the least time taken.

Answer: $22.935 \mathrm{~m}, 30.346^{0}, 1.545 \mathrm{~s}$

## Example( AMIE W 94)

The particles projected at such an angle with the horizontal that the horizontal range is four times the greatest height attained by the particles. Find the angle of projection.

## Solution

$$
\begin{align*}
& \mathrm{R}=\frac{u^{2} \sin \alpha}{g}  \tag{1}\\
& \mathrm{H}=\frac{u^{2} \sin ^{2} \alpha}{2 g} \tag{2}
\end{align*}
$$

Given, $\mathrm{H}=4 \mathrm{R}$
Solving (1) and (2)

$$
\alpha=86.42^{0}
$$

## Answer

## Example( AMIE W 93 )

A projectile is fired with initial velocity $u$ at an angle $\theta$ with the horizontal from a point $A$. Taking $A$ as the origin of co ordinate axes $x, y ; x$ along the horizontal and $y$ along the vertical, derive the expression of the path of the projectile

$$
y=x \tan \theta-\frac{\mathrm{gx}^{2}}{2 \mathrm{u}^{2}} \cdot \sec ^{2} \theta
$$

## Solution

Refer to figure.
Let $P$ be the position of the projectile after $t$ seconds: with $A x$ and Ay as coordinate axes. Let the coordinates of $P$ be ( $x, y$ ). Then $x$ is the horizontal distance travelled in $t$ seconds and $y$ the vertical

distance.
The initial horizontal velocity is ucos $\theta$.

$$
\begin{equation*}
\therefore \quad \mathrm{x}=\mathrm{t} \mathrm{x} \mathrm{u} \cos \theta \tag{1}
\end{equation*}
$$

The initial vertical velocity is usin $\theta$ with vertical acceleration -g.

$$
\begin{equation*}
\therefore \quad \mathrm{S}=(\mathrm{usin} \theta) \mathrm{t}-\frac{1}{2} \cdot \mathrm{gt}^{2} \tag{2}
\end{equation*}
$$

From (1) and (2)

$$
\begin{equation*}
\mathrm{y}=\mathrm{u} \sin \theta \cdot \frac{\mathrm{x}}{\mathrm{u} \cos \theta}-\frac{1}{2} \cdot \mathrm{~g} \cdot \frac{x^{2}}{u^{2} \cos ^{2} \theta}=\mathrm{x} \tan \theta-\frac{g x^{2}}{2 u^{2}} \cdot \sec ^{2} \theta \tag{3}
\end{equation*}
$$

This is the required equation.

## Example( AMIE S 93)

A gun is placed on a cliff as shown in the Figure. The muzzle velocity is $800 \mathrm{~m} / \mathrm{s}$. At what angle $\alpha$ must the gun point in order to hit a target $A$ as shown in the Figure.

## Solution

Refer to figure(b) .

Given $u=800 \mathrm{~m} / \mathrm{s}$
coordinates of target A : $x=30,000 \mathrm{~m}$ and $\mathrm{y}=-200 \mathrm{~m}$

$$
\begin{aligned}
& \mathrm{y}=\mathrm{x} \tan \theta-\frac{g x^{2}}{2 u^{2} \cos ^{2} \alpha} \\
& 200=30,000 \tan \alpha-\frac{9.81 \times(30,000)^{2}}{2 \times 800^{2} \cos ^{2} \alpha}
\end{aligned}
$$

solving

$$
68.98 \tan ^{2} \alpha-300 \tan \alpha+66.98=0
$$

$$
\alpha=77^{\circ} \text { and } 13^{\circ}
$$

Answer

## MECHANICAL SCIENCE <br> drnamics <br> Problem

A Focused Approach $\downarrow$ •

A ball is thrown from the top of a tower 60 m high with a velocity of $20 \mathrm{~m} / \mathrm{s}$ at an elevation of $30^{\circ}$ above the horizontal. Find the horizontal distance from the foot of the tower to the point where it hits the ground. $\left(g=10 \mathrm{~m} / \mathrm{s}^{2}\right)$.

Answer: 79.67 m

## Problem

A stone is thrown horizontally with a velocity $20 \mathrm{~m} / \mathrm{s}$ from top of a tower of height 50 m . Find where and with what velocity it will strike the level ground, through the foot of the tower.
Answer: $20 \sqrt{ } 10 \mathrm{~m}, v=10 \sqrt{ } 14 \mathrm{~m} / \mathrm{s}, \theta=\tan ^{-1}[(\sqrt{ } 10) / 2]$

## Problem

If $R$ be the range of a projectile on a horizontal plane and $h$ its maximum height, show that the maximum horizontal range with the same velocity of projection is $2 h+\frac{\mathrm{R}^{2}}{8 \mathrm{~h}}$.

Hint $: R=\frac{u^{2}}{g} \cdot \sin 2 \alpha=\frac{u^{2}}{g} \sin \alpha \cdot \cos \alpha, h=\frac{u^{2} \sin ^{2} \alpha}{2 g}, R_{\max }=\frac{u^{2}}{g}$

## Example

An aero plane is flying at a height h above a level plane with a velocity v. A bullet is fired from a gun at the instant the aero plane is vertically above the gun. Find the angle $\alpha$ of projection of the bullet and also its minimum initial velocity, so that it can hit the aero plane.

## Solution

$u=$ velocity of projection of the bullet
Obviously $\quad u \cos \alpha=v$
and $\quad \frac{u^{2} \sin ^{2} \alpha}{2 g}=$ at least h

$$
\begin{array}{ll} 
& \sin ^{2} \alpha=\frac{2 g h}{u^{2}} \text { and } \cos ^{2} \alpha=\frac{v^{2}}{u^{2}} \\
\therefore & \sin ^{2} \alpha+\cos ^{2} \alpha=\frac{2 g h}{u^{2}}+\frac{v^{2}}{u^{2}}=1 \\
\therefore & u=\sqrt{v^{2}+2 g h}
\end{array}
$$

## Newton's Law of Motion, Work, Power, Energy, Impulse, Momentum

## FIRST LAW

A body remains in a state of rest or of uniform motion in a straight line, unless it is acted upon by external forces.

## SECOND LAW

Rate of change of momentum is proportional to the impressed force and takes place in the direction in which the force acts.

The second law states that the rate of change of momentum is proportional to the resultant force on the body.

If F is the resultant force on the body,

$$
\mathrm{F} \alpha \mathrm{ma}
$$

or

$$
\mathrm{F}=\lambda \mathrm{ma}
$$

where $\lambda=$ constant, $\mathrm{a}=$ acceleration
To find the magnitude of the force we have to first select a unit of force.

$$
\mathrm{F}=\lambda \mathrm{ma}
$$

if $\mathrm{m}=1, \mathrm{a}=1$, then $\lambda=1$
Hence if the force acting on a unit mass producing unit acceleration, is taken as the unit of force then $\lambda=1$.

$$
\therefore \quad \mathrm{F}=\mathrm{ma}
$$

The unit of force in S.I. units is Newton. This is the force acting on a mass of 1 kilogram producing an acceleration of $1 \mathrm{~m} / \mathrm{s}^{2}$.

## Example

A force of 10 N acts on a body having a mass of 2 kg . for 15 seconds. If the body starts from rest, find the acceleration produced, and the distance moved in this interval.

## Solution

|  | Force $=$ mass x acceleration |
| :--- | :--- |
| $\therefore$ | acceleration $\mathrm{a}=\frac{\text { force }}{\text { mass }}=10 / 2=5 \mathrm{~m} / \mathrm{sec}^{2}$ |

Distance moved

$$
\mathrm{S}=\mathrm{ut}+\frac{1}{2} \mathrm{at}^{2}=\frac{1}{2} \mathrm{at}^{2}=\frac{1}{2} \times 5 \times(15)^{2}=562.5 \text { metres. }
$$

```
MECHANICAL SCIENCE
DYNAMICS

A railway car weighing 60 kN is capable of exerting a tractive effort of 2500 N . Find the acceleration obtained on a level track if the tractive resistance is \(6 N\) per \(k N\) of the car's weight.

\section*{Solution}

Tractive effort \(=2500 \mathrm{~N}\)
Tractive resistance \(=6 \times 60=360 \mathrm{~N}\)
Net driving force \(=2500-360=2140 \mathrm{~N}\)
Mass of the car
\[
\mathrm{m}=\mathrm{W} / \mathrm{g}=60,000 / 9.81 \mathrm{~kg} .
\]

Let the acceleration be " \(a\) " \(m / \sec ^{2}\)
\[
\begin{aligned}
& \text { Force }=\text { mass } x \text { acceleration } \\
& 2140=\frac{60,000}{9.81} \cdot \mathrm{a} \\
\therefore \quad & \mathrm{a}=0.35 \mathrm{~m} / \mathrm{sec}^{2}
\end{aligned}
\]

\section*{Work}

If a force (F) acts on a body and causes it to move some distance (s), work (W) is said to be done by that force. Its unit is \(\mathrm{N}-\mathrm{m}\).
\[
\mathrm{W}=\mathrm{Fxs}
\]

\section*{Energy}

The capacity to do work is called energy (E). It is measured in N-m.

\section*{Kinetic Energy}

This is the energy which a body possess because of its velocity.
\[
\mathrm{E}=\frac{1}{2} \mathrm{mv}^{2}
\]

\section*{Potential Energy}

This is the energy which a body possesses due to its position.
\[
\mathrm{E}=\mathrm{mgh}=\mathrm{Wh} \quad[\mathrm{~m}=\mathrm{W} / \mathrm{g}]
\]

\section*{Relation between Work and Energy}
\[
\mathrm{W}=\Delta \mathrm{E}
\]
i.e. \(\quad\) Work \(=\) change in kinetic energy

Work done by Torque or moment
When the body rotates through angle \(\theta\), the total work done is
\[
\mathrm{W}=\mathrm{M} \theta
\]

\section*{Kinetic Energy for Rotation}
\[
\mathrm{E}=\frac{1}{2} \mathrm{I}_{0} \omega^{2}
\]
where \(\mathrm{I}_{0}\) is mass moment of inertia with respect to axis of rotation.

\section*{Kinetic Energy for an object having both Linear and Rotational Motion}

Let an object is moving with linear velocity (v) and rotational velocity ( \(\omega\) ) then
\[
\mathrm{E}=\frac{1}{2} \mathrm{mv}^{2}+\frac{1}{2} \mathrm{I} \omega^{2}
\]

\section*{Power}

Power \(\quad \mathrm{P}=\mathrm{W} / \mathrm{t}=\) Work/time
Also \(\quad P=\frac{2 \pi N T}{60 \times 1000}=\frac{T \omega}{1000} \mathrm{~kW}\)
where T is the torque in \(\mathrm{N}-\mathrm{m}, \mathrm{N}\) the revolutions per minute \((\mathrm{rpm})\), v is velocity in \(\mathrm{m} / \mathrm{s}\) and F is force in N .
\[
1 \mathrm{H} . \mathrm{P} .=0.746 \mathrm{~kW}
\]

\section*{Example}

A bullet moving at the rate of \(60 \mathrm{~m} / \mathrm{s}\) is fired into a thick target which it penetrates to the extent of 15 cm ; if fired into a target 7.5 cm thick with equal velocity, with what velocity would it emerge supposing the resistance to be uniform and the same in both cases.

\section*{Solution}

Let mass of bullet be m kg . Force of resistance is F N.
Then
\[
\mathrm{W}=\Delta \mathrm{E}_{\mathrm{k}}
\]
\[
\mathrm{Fx} 0.15=\frac{1}{2} \mathrm{mx}(60)^{2}
\]
i.e. \(\quad \mathrm{F}=12000 \mathrm{mN}\)

Let v be the velocity of emergence then
\[
12000 \mathrm{~m} \times 0.075=\frac{1}{2} \mathrm{~m}\left[(60)^{2}-\mathrm{v}^{2}\right]
\]

Solving
\[
\mathrm{v}=42.426 \mathrm{~m} / \mathrm{s}
\]

\section*{MECHANICAL SCIENCE \\ drnamics \\ Problem}

AMIE(I) STUDY CIRCLE(REGD.)
A Focused Approach \(\downarrow>\)

A machine gun bullet weighing \(3 \times 10^{-3} \mathrm{~N}\) is fired with a velocity of \(500 \mathrm{~m} / \mathrm{s}\). What is the kinetic energy of the bullet? If the bullet can penetrate 30 cm in a block of wood, what is the average resistance of the wood? What will be the exit velocity of the bullet if fired into a similar block of wood 15 cm thick?

Answer: \(F=12742 \mathrm{~N}, v=353.5 \mathrm{~m} / \mathrm{s}\)

\section*{Impulse}

When a force is constant in magnitude and direction, the impulse is the product of the force and the time during which it acts.
\[
\text { Impulse }=\mathrm{Fxt}
\]

\section*{Momentum}

Momentum is the product of the force and velocity.
Momentum = m x v

Both Impulse and momentum are vector quantities and their units are N-s.

\section*{Conservation of Linear Momentum}

If the two bodies have masses \(m_{1}\) and \(m_{2}\) with velocities \(\mathrm{v}_{1}\) and \(\mathrm{v}_{2}\) respectively, before coming into contact with each other, and velocities \(\mathrm{v}_{1}{ }^{\prime}\) and \(\mathrm{v}_{2}{ }^{\prime}\) at the end of the period of contact. Then according to the conservation of linear momentum, we have

Total momentum \((\) before \()=\) Total Momentum (After)

\section*{Example}

A gun weighing 80 kN shoots a 250 N projectile in a horizontal direction with a muzzle velocity of \(500 \mathrm{~m} / \mathrm{s}\). The bullet weights 150 N and is assumed to move with one-half of the muzzle velocity of the projectile. Find the initial recoil velocity of the gun. If the recoil is resisted by a constant force, find this force if the recoil distance is 80 cm .

\section*{Solution}

Let v be the recoil velocity in \(\mathrm{m} / \mathrm{s}\).
Now momentum before
\[
=\frac{8 \times 10^{4}}{9.81} \mathrm{v}
\]

Momentum after
\[
=\frac{250}{9.81} \times 500+\frac{150}{9.81} \times \frac{500}{2}
\]

Equating we get
\[
8 \times 10^{4} v=125000+37500
\]

Solving \(\quad \mathrm{v}=2.03 \mathrm{~m} / \mathrm{s}\)
The gun moves in a direction opposite to that of the projectile.
Using the work energy relation, \(\mathrm{W}=\Delta \mathrm{E}\)
\[
\mathrm{Fx} 0.8=\frac{1}{2} \frac{80 \times 10^{4}}{9.81}\left(0-2.03^{2}\right)
\]
i.e. \(\quad \mathrm{F}=21 \mathrm{kN}\)

\section*{Example}

A body of mass 6 kg moving with a velocity of \(3 \mathrm{~m} / \mathrm{s}\) meets a body of mass 4 kg moving (a) in same direction (b) in opposite direction with a velocity of \(1.5 \mathrm{~m} / \mathrm{s}\). If they coalesce(combine) into one body, find the velocity of the compound body. Find also the loss of kinetic energy.

\section*{Solution}
(a) Let v' be the velocity after coalescing(combining).

Momentum before combining
\[
=6 \times 3+4 \times 1.5
\]

Momentum after combining
\[
=(6+4) v^{\prime}
\]

After Equating
We get \(\quad v^{\prime}=2.4 \mathrm{~m} / \mathrm{s}\)
Now Kinetic energy before combining
\[
=\frac{1}{2} \times 6 \times 3^{2}+\frac{1}{2} \times 4 \times 1.5^{2}
\]
K.E. after combining
\[
=\frac{1}{2}(6+4)(2.4)^{2}
\]

Change in K.E.
\[
=\frac{1}{2} \times 6 \times 3^{2}+\frac{1}{2} \times 4 \times 1.5^{2}-\frac{1}{2}(6+4)(2.4)^{2}=2.7 \mathrm{~N}-\mathrm{m}
\]
(b) Momentum before combining
\[
=6 \times 3-4 \times 1.5
\]

Momentum after combining
\[
=(6+4) \mathrm{v}^{\prime}
\]

Equating \(\quad v^{\prime}=1.2 \mathrm{~m} / \mathrm{s}\)
K.E. before \(=\frac{1}{2} \times 6 \times 3^{2}+\frac{1}{2} \times 4 \times 1.5^{2}\)
K.E. After \(=\frac{1}{2}(6+4)(1.2)^{2}\)

Change in K.E. \(=\frac{1}{2} \times 6 \times 3^{2}-\frac{1}{2} \times 4 \times 1.5^{2}-\frac{1}{2}(6+4)(1.2)^{2}=24.3 \mathrm{~N}-\mathrm{m}\).

\section*{Example}
\(A\) shot of mass m penetrates a thickness s of a fixed plate of mass \(M\). Prove that if \(M\) is free to move, the thickness it penetrated is \(\frac{s}{\left[1+\frac{m}{M}\right]}\)

\section*{Solution}

Let v be the velocity of the shot and F be the average resistance to penetration. When the plate is fixed, using \(W_{k}=\Delta \mathrm{E}_{\mathrm{k}}\), we get
\[
\mathrm{F}_{\mathrm{s}}=\frac{1}{2} \mathrm{mv}^{2}
\]

Let s' be the thickness penetrated when the plate is free to move, then using the principle of conservation of momentum, we have
\[
\mathrm{mv}=(\mathrm{m}+\mathrm{M}) \mathrm{v}^{\prime}
\]
and using the principle of work and energy, we have
\[
\begin{aligned}
& \mathrm{Fs}^{\prime}=\frac{1}{2} \mathrm{mv}^{2}-\frac{1}{2}(\mathrm{~m}+\mathrm{M}) \mathrm{v}^{\prime 2} \\
&=\frac{1}{2} \mathrm{mv}^{2}-\frac{1}{2} \frac{\mathrm{~m}^{2} \mathrm{v}^{2}}{\mathrm{~m}+\mathrm{M}} \\
&=\frac{1}{2} \mathrm{mv}^{2}\left[1-\frac{\mathrm{m}}{\mathrm{~m}+\mathrm{M}}\right]=\frac{1}{2} \mathrm{mv}^{2}\left[\frac{\mathrm{~m}}{\mathrm{~m}+\mathrm{M}}\right] \\
& \therefore \quad \mathrm{s}^{\prime}=\left[\frac{\mathrm{M}}{\mathrm{~m}+\mathrm{M}}\right] \mathrm{s}=\frac{\mathrm{s}}{\left[1-\frac{\mathrm{m}}{\mathrm{M}}\right]}
\end{aligned}
\]

\section*{Problem}

A gun weighing 10 kN has a recoil of 1 m when firing a 100 N projectile horizontally. If the recoil is resisted by a nest of springs that is deformed 1 mm by a force of 100 N. Find the initial recoil velocity of the gun and the muzzle velocity of the projectile.

Ans. \(9.9 \mathrm{~m} / \mathrm{s} 990 \mathrm{~m} / \mathrm{s}\)

\section*{MECHANICAL SCIENCE \\ drnamics \\ Problem}

A Focused Approach \(\downarrow>\)

A 600 N man running at \(5 \mathrm{~m} / \mathrm{s}\) jumps into a 1 kN boat. The boat is originally moving toward the man at a velocity of \(1.5 \mathrm{~m} / \mathrm{s}\). Find the velocity of the boat after the man has jumped into it.

Ans. \(2.81 \mathrm{~m} / \mathrm{s}\)

\section*{Problem}

A bullet of 125 gram strikes a target with a velocity of \(400 \mathrm{~m} / \mathrm{s}\) and is embedded in it. The target mass is 10 kg and is free to move. find the velocity of target after impact and the loss of kinetic energy.
Ans. \(4.93 \mathrm{~m} / \mathrm{s}, 9876.5 \mathrm{Nm}\)

\section*{COLLISION OF ELASTIC BODIES}

If two bodies suddenly collide, an impulsive force, or impact, is set up between them. The sum of the momenta before impact is equal to the sum of the momenta after impact, i.e., the conservation of momentum holds, thus for direct central impact, we have
\[
\mathrm{m}_{1} \mathrm{v}_{1}+\mathrm{m}_{2} \mathrm{v}_{2}=\mathrm{m}_{1} \mathrm{v}_{1}^{\prime}{ }^{\prime}+\mathrm{m}_{2} \mathrm{v}_{2}^{\prime}
\]

\section*{Coefficient of Restitution}
\[
e=\frac{v_{2}^{\prime}-v_{1}^{\prime}}{v_{1}-v_{2}}
\]
in which the proper sign of the four velocities must be included.
The value of e lies between zero and one. It is zero for perfectly inelastic bodies and one for perfectly elastic bodies.

\section*{Direct Impact of Two Spheres}

Consider the collision of two spheres, as shown in Fig. 13.5. Then
\[
\begin{equation*}
\mathrm{m}_{1} \mathrm{v}_{1}+\mathrm{m}_{2} \mathrm{v}_{2}=\mathrm{m}_{1} \mathrm{v}_{1}^{\prime}+\mathrm{m}_{2} \mathrm{v}_{2}^{\prime} \tag{a}
\end{equation*}
\]

Also \(\quad e=\frac{v_{2}{ }^{\prime}-v_{1}^{\prime}}{v_{1}-v_{2}}\)
or
\[
\begin{align*}
& \mathrm{v}_{2}^{\prime}-\mathrm{v}_{1}^{\prime}=\left(\mathrm{v}_{1}-\mathrm{v}_{2}\right) \\
& \mathrm{m}_{1} \mathrm{v}_{2}^{\prime}-\mathrm{m}_{1} \mathrm{v}_{1}^{\prime}=\mathrm{m}_{1} \mathrm{e}\left(\mathrm{v}_{1}-\mathrm{v}_{2}\right) \tag{c}
\end{align*}
\]

Adding Eqs. (a) and (c), we get
\[
\begin{array}{ll} 
& \left(\mathrm{m}_{1}+\mathrm{m}_{2}\right) \mathrm{v}_{2}^{\prime}=\mathrm{m}_{1} \mathrm{v}_{1}=\mathrm{m}_{2} \mathrm{v}_{2}+\mathrm{m}_{1} \mathrm{e}\left(\mathrm{v}_{1}-\mathrm{v}_{2}\right) \\
\therefore & \mathrm{v}_{2}{ }^{\prime}=\frac{\mathrm{m}_{1} \mathrm{v}_{1}(1+\mathrm{e})+\mathrm{v}_{2}\left(\mathrm{~m}_{2}-\mathrm{m}_{1} \mathrm{e}\right)}{\mathrm{m}_{1}+\mathrm{m}_{2}}
\end{array}
\]

Similarly, \(\quad \mathrm{v}_{1}{ }^{\prime}=\frac{\mathrm{v}_{1}\left(\mathrm{~m}_{1}-\mathrm{m}_{2} \mathrm{e}\right)+\mathrm{m}_{2} \mathrm{v}_{2}(1+\mathrm{e})}{\mathrm{m}_{1}+\mathrm{m}_{2}}\)
If \(m_{1}=m_{2}\), then
\[
\begin{aligned}
& v_{1}^{\prime}=\frac{v_{1}(1-e)+v_{2}(1+e)}{2} \\
& v_{2}^{\prime}=\frac{v_{1}(1+e)+v_{2}(1-e)}{2}
\end{aligned}
\]

\section*{Example}

A ball of mass 4 kg moving with a velocity of \(1.5 \mathrm{~m} / \mathrm{s}\) is overtaken by a ball of mass 6 kg moving with a velocity of \(3 \mathrm{~m} / \mathrm{s}\). (a) in the same direction as the first (b) in the opposite direction. If \(e=1 / 5\), find the velocity of the two balls after impact. Find also the loss of energy in the first case.

\section*{Solution}

Given \(\mathrm{m}_{1}=4 \mathrm{~kg}, \mathrm{v}_{1}=1.5 \mathrm{~m} / \mathrm{s}, \mathrm{m}_{2}=6 \mathrm{~kg}, \mathrm{v}_{2}=3 \mathrm{~m} / \mathrm{s}, \mathrm{e}=1 / 5=0.2\)
(a)
\[
m_{1} v_{1}+m_{2} v_{2}=m_{1} v_{1}{ }^{\prime}+m_{2} v_{2}{ }^{\prime}
\]
i.e.
\[
4 \times 1.5+6 \times 3=4 \mathrm{v}_{1}{ }^{\prime}+6 \mathrm{v}_{2}{ }^{\prime}
\]
\[
\begin{equation*}
\therefore \quad \mathrm{v}_{1}{ }^{\prime}+1.5 \mathrm{v}_{2}{ }^{\prime}=6 \tag{1}
\end{equation*}
\]

Also \(\quad e=\frac{v_{2}{ }^{\prime}-v_{1}{ }^{\prime}}{v_{1}-v_{2}}\)
i.e. \(\quad 0.2=\frac{\mathrm{v}_{2}{ }^{\prime}-\mathrm{v}_{1}{ }^{\prime}}{1.5-3}\)
\(\therefore \quad \mathrm{v}_{1}{ }^{\prime}-\mathrm{v}_{2}{ }^{\prime}=0.75\)
Solving (1) and (2), we get
\[
\mathrm{v}_{1}^{\prime}{ }^{\prime}=2.85 \mathrm{~m} / \mathrm{s} \text { and } \mathrm{v}_{2}^{\prime}=2.1 \mathrm{~m} / \mathrm{s}
\]

Loss in kinetic energy
\[
\begin{aligned}
\Delta \mathrm{E} & =\frac{1}{2}\left(\mathrm{~m}_{1} \mathrm{v}_{1}^{2}+\mathrm{m}_{2} \mathrm{v}_{2}{ }^{2}\right)-\frac{1}{2}\left(\mathrm{~m}_{1} \mathrm{v}_{1}{ }^{\prime 2}+\mathrm{m}_{2} \mathrm{v}_{2}{ }^{12}\right) \\
& =\frac{1}{2}(4 \times 2.25+6 \mathrm{x} 9)-\frac{1}{2}(4 \times 4.41+6 \times 8.1225) \\
& =-1.6875 \mathrm{Nm}
\end{aligned}
\]
(b) \(\quad \mathrm{m}_{1} \mathrm{v}_{1}-\mathrm{m}_{2} \mathrm{v}_{2}=\mathrm{m}_{1} \mathrm{v}_{1}{ }^{\prime}+\mathrm{m}_{2} \mathrm{v}_{2}{ }^{\prime}\)
i.e.
\[
4 \times 1.5-6 \times 3=4 \mathrm{v}_{1}{ }^{\prime}+6 \mathrm{v}_{2}{ }^{\prime}
\]

Also
\[
\begin{equation*}
\mathrm{v}_{1}^{\prime}+1.5 \mathrm{v}_{2}^{\prime}=-3 \tag{1}
\end{equation*}
\]
\[
0.2=\frac{\mathrm{v}_{2}{ }^{\prime}-\mathrm{v}_{1}{ }^{\prime}}{\mathrm{v}_{1}+\mathrm{v}_{2}}=\frac{\mathrm{v}_{2}{ }^{\prime}-\mathrm{v}_{1}{ }^{\prime}}{1.5+3}
\]
\[
\begin{equation*}
\therefore \quad \mathrm{v}_{2}{ }^{\prime}-\mathrm{v}_{1}^{\prime}=0.9 \tag{2}
\end{equation*}
\]

Solving, we get
\[
\mathrm{v}_{1}^{\prime}{ }^{\prime}=-1.74 \mathrm{~m} / \mathrm{s} \text { and } \mathrm{v}_{2}{ }^{\prime}=-0.84 \mathrm{~m} / \mathrm{s}
\]
(minus sign shows that velocity direction is opposite to their direction before impact)

\section*{Problem}

A 100 N body moving toward the right with a velocity of \(12 \mathrm{~m} / \mathrm{s}\) collides with a 50 N body moving on the same line at \(10 \mathrm{~m} / \mathrm{s}\) towards the left. Determine the final velocity of each body and the percentage loss of kinetic energy by taking \(e=0.8\).

Answer: \(10.8 \mathrm{~m} / \mathrm{s}, 12.4 \mathrm{~m} / \mathrm{s}\)

\section*{Example}

A bullet of mass \(m\), moving with a horizontal velocity \(v\), strike a stationary bock of mass \(M\), suspended by a string of length L. The bullet gets embedded in the block. What is the maximum angle made by the string with the vertical?

\section*{Solution}

Let v be the velocity of mass ( \(\mathrm{M}+\mathrm{m}\) ), then, applying law of conservation of momentum,
\[
\begin{align*}
\mathrm{mv} & =(\mathrm{M}+\mathrm{m}) \mathrm{V} \\
\mathrm{~V} & =\frac{\mathrm{mv}}{\mathrm{M}+\mathrm{m}} \tag{i}
\end{align*}
\]

Now apply law of conservation of energy,
\[
\begin{array}{ll} 
& \frac{1}{2}(\mathrm{M}+\mathrm{m}) \mathrm{V}^{2}=(\mathrm{M}+\mathrm{m}) \mathrm{gh} \\
& \frac{1}{2}(\mathrm{M}+\mathrm{m}) \frac{\mathrm{m}^{2} \mathrm{v}^{2}}{(\mathrm{M}+\mathrm{m})^{2}}=(\mathrm{M}+\mathrm{m}) g \mathrm{gL}(1-\cos \theta) \\
\text { or } \quad & \frac{1}{2} \frac{\mathrm{~m}^{2} v^{2}}{\mathrm{M}+\mathrm{m}}=(\mathrm{M}+\mathrm{m}) \operatorname{gL}(1-\cos \theta) \\
& \cos \theta=1-\frac{\mathrm{m}^{2} v^{2}}{2 g L(M+m)^{2}}
\end{array}
\]

or
\[
\theta=\cos ^{-1}\left[1-\frac{\mathrm{m}^{2} \mathrm{v}^{2}}{2 \mathrm{gL}(\mathrm{M}+\mathrm{m})^{2}}\right] .
\]

\section*{Problem}

A ball moving with a speed of \(9 \mathrm{~m} / \mathrm{s}\) strikes an identical stationary ball such that after collision the direction of each ball makes an angle of \(30^{\circ}\) with the original line of motion. Find the speed of two balls after the collision. Is kinetic energy conserved in this collision process?
Answer: \(3 \sqrt{ } 3 \mathrm{~m} / \mathrm{s}\)

\section*{Simple Harmonic Motion}

The motion of a point is defined as simple harmonic motion when the point moves in a straight line and has an acceleration that is opposite and is directly proportional to its displacement from fixed reference at the midpoint of the path. Consider a point P moving along the path AOB , as shown is Fig. such that the acceleration of P is always equal in magnitude to kx and is always directed towards O , the motion of P will be simple harmonic. This can be expressed as:
\[
\mathrm{a}=\frac{\mathrm{d}^{2} \mathrm{x}}{\mathrm{dt}^{2}}=-\mathrm{kx}
\]
in which k is a constant and x is the displacement from O .
Now let us consider the motion of a point P moving in a circle as shown in Fig., with a constant angular speed \(\omega\). When the point P moves along the circle ABCD , the point Q moves along the horizontal diameter of the circle AC . Let the point P be at the position as shown in the figure after a time t , so that \(\theta=\omega \mathrm{t}\). Let \(\mathrm{OQ}=\mathrm{x}\). Then
\[
\begin{aligned}
\mathrm{x}=\cos \theta & =\mathrm{r} \cos \omega \mathrm{t} \\
\therefore \quad \frac{\mathrm{dx}}{\mathrm{dt}} & =\mathrm{v}=-\mathrm{r} \omega \sin \omega \mathrm{t} \\
\frac{\mathrm{~d}^{2} \mathrm{x}}{\mathrm{dt}^{2}} & =\mathrm{a}=-\mathrm{r} \omega^{2} \cos \omega \mathrm{t}=-\mathrm{x} \omega^{2}
\end{aligned}
\]

Now, we shall define some of the terms related to simple harmonic motion.

\section*{Amplitude}

It is the maximum displacement of the point executing simple harmonic motion from the mean position .

\section*{Period (T)}

It is time required for one complete oscillation, i.e., the total time taken by point Q in above in traversing the path from O to \(\mathrm{A}, \mathrm{A}\) to C and C to O . thus
\[
\mathrm{T}=\frac{2 \pi}{\omega}
\]

\section*{Frequency (f)}

It is the number of oscillations performed per second. Thus
\[
\mathrm{f}=\frac{1}{\mathrm{~T}}=\frac{\omega}{2 \pi}
\]

\section*{Example}

The crank of an engine is 22.5 cm and is rotating at 150 rpm . The connecting rod is 90 cm in length. Assuming the motion to be simple harmonic, determine the maximum velocity and acceleration of the piston.

Solution
\[
\omega=\frac{2 \pi \mathrm{~N}}{60}=\frac{2 \pi \mathrm{x} 150}{60}=15.7 \mathrm{rad} / \mathrm{s}
\]

Maximum velocity,
\[
\mathrm{v}_{\max }=\mathrm{rw}=0.225 \times 15.7=3.53 \mathrm{~m} / \mathrm{s}
\]

Maximum acceleration,
\[
\mathrm{a}_{\max }=\mathrm{rw}^{2}=0.225 \times(15.7)^{2}=55.51 \mathrm{~m} / \mathrm{s}^{2}
\]
\(\mathrm{v}_{\text {max }}\) occurs at \(\theta=90^{\circ}\) or \(270^{\circ}\) and \(\mathrm{a}_{\text {max }}\) occurs when \(\theta=0^{\circ}\) or \(180^{\circ}\).

\section*{FREE VIBRATIONS}

\section*{Vibration}

To and fro motion of a body about a mean position is called vibration.

\section*{Free Vibration}

If the system, after it is disturbed, is left to vibrate on its own, the ensuing vibration is known as free vibration.

\section*{Natural Frequency}

The frequency with which it vibrates of its own is called natural frequency.

\section*{Spring}

It is device which can store some energy and release it later on.

\section*{Stiffness}

It is the load per unit deflection.

\section*{EQUIVALENT SPRINGS}

\section*{Springs in Series}

For the two springs in series having stiffness \(\mathrm{k}_{1}\) and \(\mathrm{k}_{2}\) as shown in figure, we have Total deflection
\[
\begin{array}{ll} 
& \mathrm{x}=\mathrm{x}_{1}+\mathrm{x}_{2} \\
\therefore & \frac{\mathrm{~W}}{\mathrm{k}}=\frac{\mathrm{W}}{\mathrm{k}_{1}}+\frac{\mathrm{W}}{\mathrm{k}_{2}} \\
\therefore & \frac{1}{\mathrm{k}_{1}}=\frac{1}{\mathrm{k}_{1}}+\frac{1}{\mathrm{k}_{2}}
\end{array}
\]

\section*{Springs in Parallel}

For the two springs in parallel as shown in given figure, we have

\[
\begin{aligned}
& \mathrm{W}=\mathrm{k}_{1} \mathrm{X}+\mathrm{k}_{2} \mathrm{X}=\mathrm{kx} \\
& \mathrm{k}=\mathrm{k}_{1}+\mathrm{k}_{2}
\end{aligned}
\]

Consider a single degree of freedom spring-mass system as shown in figure (a). Let the mass m be given a small displacement x in the downward direction. The forces acting on the mass are shown in free body diagram for the mass in figure (b).

(a) Spring-mass system

(b) Free body diagram for mass

These forces are
(a) Inertia force m \(\ddot{x}\) acting in the upward direction.
(b) Spring force kx acting upwards

Now
\[
\mathrm{m} \ddot{\mathrm{x}}+\mathrm{kx}=0
\]
i.e. \(\quad \ddot{\mathrm{x}}+\frac{\mathrm{k}}{\mathrm{m}} \mathrm{x}=0\)

Let \(\mathrm{k} / \mathrm{m}=\omega_{\mathrm{n}}{ }^{2}\), then we have
\[
\ddot{\mathrm{x}}+\omega_{\mathrm{n}}^{2} \mathrm{x}=0
\]

\section*{MECHANICAL SCIENCE}
dYnamics

Determine the frequency of natural vibration of the system shown in given figure.

\section*{Solution}

Downward displacement of pulley A
\[
=\frac{2 \mathrm{~W}}{\mathrm{k}_{1}}
\]

Upward displacement of pulley B
\[
=\frac{2 \mathrm{~W}}{\mathrm{k}_{2}}
\]

Total displacement of weight \(\mathrm{W}=2\left(\frac{2 \mathrm{~W}}{\mathrm{k}_{1}}+\frac{2 \mathrm{~W}}{\mathrm{k}_{2}}\right)\)
Let \(k_{e}\) be the equivalent spring stiffness, then
\[
\begin{aligned}
\frac{\mathrm{W}}{\mathrm{k}_{\mathrm{e}}} & =4 \mathrm{~W}\left(\frac{1}{\mathrm{k}_{1}}+\frac{1}{\mathrm{k}_{2}}\right) \\
\therefore \quad & \frac{1}{\mathrm{k}_{\mathrm{e}}}
\end{aligned}=4\left(\frac{1}{\mathrm{k}_{1}}+\frac{1}{\mathrm{k}_{2}}\right)
\]

Equation of motion of weight W is therefore
\[
\frac{\mathrm{W}}{\mathrm{~g}} \ddot{\mathrm{x}}+\mathrm{k}_{\mathrm{e}} \mathrm{x}=0
\]
or
\[
\therefore \quad \omega_{\mathrm{n}}=\sqrt{\frac{\mathrm{k}_{\mathrm{e}} \mathrm{~g}}{\mathrm{~W}}}=\sqrt{\frac{\mathrm{k}_{1} \mathrm{k}_{2} \mathrm{~g}}{4\left(\mathrm{k}_{1}+\mathrm{k}_{2}\right) \mathrm{W}}}
\]
\(\therefore \quad f_{n}=\frac{1}{2 \pi} \sqrt{\frac{k_{1} k_{2} g}{4\left(k_{1}+k_{2}\right) W}}\)

\section*{Example}

Find the natural frequency of the system shown in figure.

\section*{Solution}

Neglecting the weight of the pulley, if x is the total deflection, then deflection of the lower spring
\[
=\frac{\mathrm{W}}{\mathrm{k}_{2}}
\]
and deflection of the upper spring
\[
=\frac{\mathrm{W}}{2 \mathrm{k}_{1}}
\]

Deflection of pulley

\[
\begin{array}{ll} 
& =\frac{W}{4 \mathrm{k}_{2}} \\
\therefore \quad & \mathrm{x}=\frac{\mathrm{W}}{\mathrm{k}_{2}}+\frac{\mathrm{W}}{4 \mathrm{k}_{1}}+\frac{\mathrm{W}}{\mathrm{k}_{\mathrm{e}}} \\
& \mathrm{k}_{\mathrm{e}}=\frac{4 \mathrm{k}_{1} \mathrm{k}_{2}}{\mathrm{k}_{2}+4 \mathrm{k}_{1}}
\end{array}
\]

Equation of motion is: \(\mathrm{m} \ddot{\mathrm{x}}+\mathrm{k}_{\mathrm{e}} \mathrm{x}=0\)
\[
\omega_{\mathrm{n}}=\sqrt{\frac{\mathrm{k}_{\mathrm{e}}}{\mathrm{~m}}}=\sqrt{\frac{4 \mathrm{k}_{1} \mathrm{k}_{2} \mathrm{~g}}{4\left(\mathrm{k}_{1}+\mathrm{k}_{2}\right) \mathrm{W}}}
\]

\section*{Example}

Determine the periods of vibration of weight \(P\) attached to spring of stiffness \(k_{1}\) and \(k_{2}\) two different cases, as shown in Figure.

(a)

(b)

In the case (a) the two springs are in series. Hence
\[
\begin{aligned}
& \mathrm{k}_{\mathrm{e}}=\frac{\mathrm{k}_{1} \mathrm{k}_{2}}{\mathrm{k}_{1}+\mathrm{k}_{2}} \\
& \omega_{\mathrm{n}}=\sqrt{\frac{\mathrm{k}_{1} \mathrm{k}_{2} \mathrm{~g}}{\left(\mathrm{k}_{1}+\mathrm{k}_{2}\right) \mathrm{P}}} \\
& \mathrm{~T}=2 \pi \sqrt{\frac{\mathrm{P}}{\mathrm{~g}} \cdot\left(\frac{\mathrm{k}_{1}+\mathrm{k}_{2}}{\mathrm{k}_{1} \mathrm{k}_{2}}\right)}
\end{aligned}
\]

In the case (b) the two springs are in parallel. Hence
\[
\begin{aligned}
& \mathrm{k}_{\mathrm{e}}=\mathrm{k}_{1}+\mathrm{k}_{2} \\
& \omega_{\mathrm{n}}=\sqrt{\frac{\left(\mathrm{k}_{1}+\mathrm{k}_{2}\right) \mathrm{P}}{\mathrm{P}}} \\
& \mathrm{~T}=2 \pi \sqrt{\frac{\mathrm{P}}{\mathrm{~g}} \cdot \frac{1}{\left(\mathrm{k}_{1}+\mathrm{k}_{2}\right)}}
\end{aligned}
\]

\section*{Example}

The weight \(W\) is suspended from a system of springs shown in figure. The rigid bar to which the springs are attached is assumed weightless. If the weight \(W\) is pulled down and released, find the frequency and period of its vibrations.

\section*{Solution}

Springs A, B and C are in parallel, whose equivalent stiffness \(=2 \mathrm{k}_{1}+\mathrm{k}_{2}\).
Now spring D is in series with these springs. Hence total equivalent stiffness,
\[
\begin{aligned}
& \frac{1}{\mathrm{k}_{\mathrm{e}}} & =\frac{1}{2 \mathrm{k}_{1}+\mathrm{k}_{2}}+\frac{1}{\mathrm{k}_{3}} \\
\therefore & \mathrm{k}_{\mathrm{e}} & =\frac{\left(2 \mathrm{k}_{1}+\mathrm{k}_{2}\right) \mathrm{k}_{3}}{2 \mathrm{k}_{1}+\mathrm{k}_{2}+\mathrm{k}_{3}}
\end{aligned}
\]

Equation of motion is

\section*{MECHANICAL SCIENCE}
dynamics

AMIE(I) STUDY CIRCLE(REGD.)
A Focused Approach \(\rightarrow>\)
\[
\begin{array}{ll} 
& m \ddot{x}+k_{\mathrm{e}} \mathrm{x}=0 \\
\therefore \quad & \omega_{\mathrm{n}}=\sqrt{\frac{\mathrm{k}_{\mathrm{e}}}{\mathrm{~m}}}=\sqrt{\frac{\left(2 \mathrm{k}_{1}+\mathrm{k}_{2}\right) \mathrm{k}_{3} \mathrm{~g}}{\left(2 \mathrm{k}_{1}+\mathrm{k}_{2}+\mathrm{k}_{3}\right) \mathrm{W}}} \\
& \mathrm{~T}=2 \pi \sqrt{\frac{\left(2 \mathrm{k}_{1}+\mathrm{k}_{2}+\mathrm{k}_{3}\right) \mathrm{W}}{\left(2 \mathrm{k}_{1}+\mathrm{k}_{2}\right) \mathrm{k}_{3} \mathrm{~g}}}
\end{array}
\]

\section*{MECHANICAL SCIENCE dYnamics \\ ASSIGNMENT \\ MOTION}
Q.1. (AMIE S11, 12, 13, 4 marks): Derive an expression for the time taken by a body, projected vertically upwards with a velocity \(u\), to reach a height A.

Answer: \(\mathrm{t}=\mathrm{u} / \mathrm{g}\)
Q.2. (AMIE S05, 6 marks): Derive the following equations of motion of a body moving in a straight line with uniform acceleration:
(i) \(S=u t+\frac{1}{2} a t^{2}\)
(ii) \(V^{2}=u^{2}+2 a S\)
Q.3. (AMIE S05, 6 marks): A particle starts from rest and moves along a straight line with constant acceleration. If it acquires a velocity of 3.0 metre per second after having travelled a distance of 7.5 metre, find the magnitude of the acceleration.

Answer: \(0.6 \mathrm{~m} / \mathrm{sec}^{2}\)
Q.4. (AMIE S05, 7 marks): An object is thrown vertically upward with a velocity of \(30 \mathrm{~m} / \mathrm{s}\). Four seconds later a second object is thrown upward with a velocity of \(40 \mathrm{~m} / \mathrm{s}\). Determine
(i) the time (after the first object is thrown) when the two objects will meet each other in air
(ii) the height from the earth at which the two objects will meet.

Answer: \(2.788 \mathrm{sec}, 45.52 \mathrm{~m}\)
Q.5. (AMIE W07, 7 marks): A particle moving along a straight line has an acceleration \(a=\sqrt{V}\). At time \(\mathrm{t}=\) 2 s , its displacement is 42.67 m and velocity is \(16 \mathrm{~m} / \mathrm{s}\). Find the displacement, velocity and acceleration at \(\mathrm{t}=3 \mathrm{~s}\).

Answer: \(56.0025 \mathrm{~m}, 10.665 \mathrm{~m} / \mathrm{s},-5.335 \mathrm{~m} / \mathrm{s}^{2}\)
Q.6. (AMIE W08, 8 marks): A panicle moves with rectilinear motion and its speed rises from 0 to \(12 \mathrm{~m} / \mathrm{s}\) in 4 s and then drops to 0 in 2 s . Plot the velocity-time curve and find
(i) acceleration in first 4 s and that in last 2 s ;
(ii) distance travelled in 6 s ; and
(iii) average velocity.

Answer: \(3 \mathrm{~m} / \mathrm{s} 2,6 \mathrm{~m} / \mathrm{s}^{2} ; 36 \mathrm{~m}\)
Q.7. (AMIE W09, 8 marks): The driver of an automobile, travelling along a straight level highway, suddenly applies the brakes so that the car slides for 2 sec covering a distance of 9.81 m before coming to a stop. Assuming that during this time the car moved with constant deceleration, find the coefficient of friction between the tires and the pavement.

Answer: \(\mu=0.5\),
Q.8. (AMIE S10, 6 marks): A ball is dropped from a height of 100 cm on a smooth floor. The height of the first bounce is 81 cm . Determine the (i) coefficient of restitution, and (ii) expected height of the second bounce.

Answer: 0.9, 0.656 m
Q.9. (AMIE W10, \(\mathbf{5}\) marks): A motorist is travelling at 80 kmph , when he observes a traffic light 200 m ahead of him turns red. The traffic light is timed to stay red for 10 sec . If the motorist wishes to pass the light without

\section*{MECHANICAL SCIENCE DYMamics}
stopping, just as it turns green, determine the (i) required uniform deceleration, and (ii) speed as it passes the light.

Answer: \(-0.444 \mathrm{~m} / \mathrm{s}^{2}, 17.78 \mathrm{~m} / \mathrm{s}\)
Q.10. (AMIE S11, 12, 13, 4 marks): A stone after falling from rest for 4 sec breaks a glass plane and in breaking it looses \(25 \%\) of its velocity. How far will it fall in the next second?

Answer: 34.335 m
Q.11. (AMIE W11, 6 marks): An elevator ascends with an upward acceleration of \(1.2 \mathrm{~m} / \mathrm{s}^{2}\). At the instant when the upward speed is \(24 \mathrm{~m} / \mathrm{s}\), a loose bolt drops from the ceiling of the elevator located 2.75 m from its floor. Calculate the (i) time of flight of the bolt from ceiling to floor of the elevator, (ii) displacement and the distance covered by the bolt during free fall relative to elevator shaft.

Answer: \(0.70 \mathrm{sec}, 2.31 \mathrm{~m}, 2.69 \mathrm{~m}\)
Q.12. (AMIE W11, 5 marks): A large balloon is rising up with a velocity of \(9.81 \mathrm{~m} / \mathrm{s}\) at an altitude of 39.2 m from the ground. At that instant, a stone of mass 5 kg is dropped from it. After how many seconds will the stone reach the ground?

Answer: 4 sec
Q.13. (AMIE W12, 8 marks): The relation \(\mathrm{a}=2 \mathrm{t}\) defines the motion of a particle. It is given that \(\mathrm{s}=1.2 \mathrm{~m}\) and \(\mathrm{v}=0.6 \mathrm{~m} / \mathrm{s}\) when \(\mathrm{t}=1 \mathrm{sec}\). Find s and v at \(\mathrm{t}=4 \mathrm{sec}\).

Answer: 21 m, 15.6 m/s

\section*{PROJECTILES}
Q.14. (AMIE S08, 6 marks): A projectile is fired with an angle of projection a. Find the expression for the trajectory of the projectile. Also, find the maximum range and maximum height of the flight of the projectile.
Q.15. (AMIE S05, 6 marks): Find the initial velocity \(\mathrm{v}_{0}\) with which a projectile would have to be thrown out at the surface of the earth so that it rises to infinite height. Neglect air resistance, and take the radius of the earth 6336 km.

Answer: \(7.88 \mathrm{~km} / \mathrm{sec}\)
Q.16. (AMIE W09, 6 marks): The pilot of an aeroplane, flying horizontally with constant speed \(\mathrm{K}=480 \mathrm{kmph}\) at an elevation \(\mathrm{h}=610 \mathrm{~m}\) above a level plane, wishes to bomb a target B on the ground. At what angle, \(\theta\), below the horizontal should he see the target at the instant of releasing the bomb in order to score a hit ? Neglect air resistance.

Answer: \(22.3^{0}\)
Q.17. (AMIE S10, 8 marks): A particle is projected with a velocity of \(5 \mathrm{~m} / \mathrm{s}\) at an elevation of \(60^{\circ}\) to the horizontal. Find the velocity of projection of another particle thrown at an angle of \(45^{\circ}\) which will have equal (i) horizontal range, (ii) maximum height, and (iii) time of flight.

Answer: \(2.207 \mathrm{~m}, 0.9556 \mathrm{~m}, 0.8828 \mathrm{~m}\)
Now for second particle
\(4.653 \mathrm{~m} / \mathrm{s}, 6.12 \mathrm{~m} / \mathrm{s}, 6.124 \mathrm{~m} / \mathrm{s}\)

\section*{MECHANICAL SCIENCE DYMamics}
Q.18. (AMIE W10, 5 marks): A bullet is fired from a height of 120 m at a velocity of 360 kmph at an angle of \(30^{\circ}\) upward. Neglecting air resistance, find (i) total time of flight, (ii) horizontal range of the bullet, (iii) maximum height reached by the bullet, and (iv) final velocity of the bullet just before touching the ground.

Answer: \(10.04 \mathrm{sec}, 869.46 \mathrm{~m}, 247.42 \mathrm{~m}, 86.6 \mathrm{~m} / \mathrm{s}\)
Q.19. (AMIE S11, 6 marks): A cricket ball thrown from a height of 1.8 m at an angle of \(30^{\circ}\) from the horizontal with a velocity of \(18 \mathrm{~m} / \mathrm{s}\) is caught by a fieldsman at a height of 60 cm from the ground. How far apart were the two men?

Answer: 15.26 m
Q.20. (AMIE S12, 6 marks): A ball is projected from the ground at an angle of 60 with the horizontal with a velocity of \(40 \mathrm{~m} / \mathrm{s}\). Find the distance covered by the ball vertically and horizontally after 2 sec .

Answer: \(40 \mathrm{~m}, 49.66 \mathrm{~m}\)
Q.21. (AMIE W13, 6 marks): A projectile is aimed at a target on the horizontal plane and falls 12 m short when the angle of projection is \(15^{\circ}\), while it overshoots by 24 m when the angle is \(45^{\circ}\). Find the angle of projection to hit the target.
Answer: \(20^{0} 54\),

\section*{NEWTON'S LAW OF MOTION/WORK/ENERGY/POWER}
Q.22. (AMIE S07, 4 marks): State Newton's laws of motion.
Q.23. (AMIE S07, 8 marks): A particle initially at rest is submitted to the action of a force F-kt; where \(t\) is the time and k , a constant. Prove that the ratio of displacement x at any time to the velocity of the particle at that time is a linear function of time.
Q.24. (AMIE S08, 8 marks): Two billiard balls of same size and mass collide with the velocities of approach \(1.6 \mathrm{~m} / \mathrm{s}\) and \(3.5 \mathrm{~m} / \mathrm{s}\), respectively. The angle between their directions of motion is \(45^{\circ}\). For a coefficient of restitution of 0.9 , what are the final velocities of the balls immediately after the impact? What is the loss in kinetic energy?

Answer: \(2.65 \mathrm{~m} / \mathrm{s}\) and \(2.75 \mathrm{~m} / \mathrm{s}\)
Q.25. (AMIE S10, 6 marks): A bullet, moving at the rate of \(300 \mathrm{~m} / \mathrm{s}\), is fired into a thick block of target and penetrates up to 0.5 m . If it is fired into a 0.25 m thick target, find the velocity of emergence. The two block are of same material and take the resistance to be uniform in both the cases.

Answer: \(212.13 \mathrm{~m} / \mathrm{sec}\)
Q.26. (AMIE W12, 8 marks): A 150 kg scooterist is travelling with a speed of 36 kmph on a road that makes an angle of \(30^{\circ}\) with another road upon which a 60 kg cyclist is travelling at 8 kmph . When they approach the crossing, they collide and move as one mass. Determine the final velocity, both in magnitude and direction.
Answer: \(27.71 \mathrm{kmph}, 2.36^{0}\)
Q.27. (AMIE W12, 4 marks): Define force, work, momentum and impulse.
Q.28. (AMIE S11, 6 marks): An engine of mass 50 tonnes pulls a train of mass 250 tonnes up a gradient of 1 in 120 with a uniform speed of 36 kmph . Find the power exerted by the engine, if the tractive resistance is 60 N per tonne.

Answer: 425.25 kW

\section*{SIMPLE HARMONIC MOTION}
Q.29. (AMIE W08, 4 marks): What is simple harmonic motion? Write the equation of motion of a undamped spring-mass system.

\section*{MECHANICAL SCIENCE DYMamics}
Q.30. (AMIE S05, 9 marks): In a mechanism a cross-head moves in a straight guide with simple harmonic motion. At a distance 125 mm and 200 mm from its mean position, it has velocities of \(6 \mathrm{~m} / \mathrm{s}\) and \(3 \mathrm{~m} / \mathrm{s}\) respectively. Find the amplitude, maximum velocities and period of vibration. If the cross-head has a mass of 0.2 kg , calculate the maximum force on it in the direction of motion.

Answer: \(219.37 \mathrm{~mm}, 33.3 \mathrm{rad} / \mathrm{sec}, 0.188 \mathrm{~s}, 48.6 \mathrm{~N}\)
Q.31. (AMIE S08, 6 marks): A vibrating system is shown in Fig. The block is pulled 40 mm down from its equilibrium position and released. For springs, \(\mathrm{k}_{1}=4 \mathrm{kN} / \mathrm{m}\) and \(\mathrm{k}_{2}=6 \mathrm{kN} / \mathrm{m}\).

Determine the period of vibration, the minimum velocity of block, and the maximum acceleration of block. The mass of the block is 50 kg .

Answer: \(0.444 \mathrm{sec}, 0, \pm 8.008 \mathrm{~m} / \mathrm{s}^{2}\)
Q.32. (AMIE S09, 8 marks): Explain the principle of free vibration. Derive the equation of motion of a vertically moving undamped spring mass system.
Q.33. (AMIE W11, 3 marks): A small motor of mass 20 kg is symmetrically mounted on four equal springs, each with a spring constant of \(25 \mathrm{~N} / \mathrm{cm}\). Estimate the frequency and period of vibration of the motor.

Answer: 3.57 cycles \(/ \mathrm{sec}, 0.28 \mathrm{sec}\)
(For online support such as eBooks, video lectures, unsolved papers, quiz, test series and course updates, visit www.amiestudycircle.com)```
